The standalone product from the Quite Software Stables.

Built on the rock-solid foundations of **Quite Imposing Plus** and the **Adobe® Acrobat® PDF Library™**, you can now integrate your imposition functions into heavy duty, demanding workflows.

This product can be used in 2 different ways: as a **Hot Folder** tool or a **Command Line** tool.

Designed to be intuitive and easy to use **Quite Hot Imposing** is available for both Mac & Win users.

# Quite Hot Imposing

## Hot Folders.

Quite Hot Imposing lets you set up multiple hot folders and each setup (called a **queue**) has four different folders.

- **IN** folder: PDF files to be processed are put into this folder.
- **OUT** folder: the resulting file, an imposed layout, is put here. The name will be the same as the original file.
- **DONE** folder: the original file is moved to here, unchanged. This is done so that no files are destroyed and the file will only be moved to **done** when processing is successful.
- **ERROR** folder: if a file cannot be processed we can't just leave it in the IN folder as it would be processed again right away! So files which fail are moved to error.

All your setups can be saved and repeated on other jobs when needed. (We call this 'Imposition by Example.)

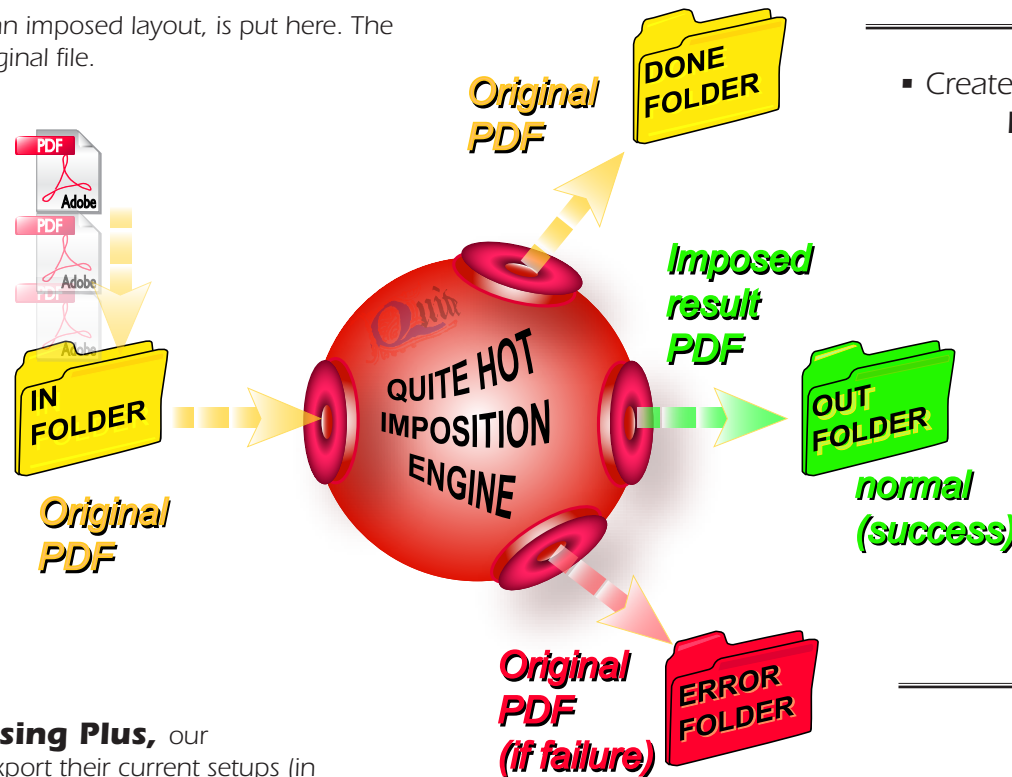

Current users of **Quite Imposing Plus**, our Acrobat plug-in, will be able to export their current setups (in XML) into **Quite Hot Imposing**.

## Command Line.

At the heart of the hot folder tool is a powerful command line tool for high power workflows.

With a simple command syntax:

**qi\_applycommands -control** filename **-source** filename **-target** filename

- 
- Create customised workflows using either **hot folder** or **command-line** tools

- Work easily with PDF files integrated into an automatic workflow

- Save time by quickly setting up a queue using the **Express Setup** button

- Handle multiple hot folder set ups each doing different imposition jobs
